2018 National Pulp & Paper Sustainability Report

Good for the environment, people & Australia
Australia’s paper and paperboard manufacturing industry continued its role as a global sustainability leader in 2018.

The industry is committed to improving its sustainability and to communicating its progress on the sustainability journey to its stakeholders.

Members of the Australian Forest Products Association (AFPA) either improved their sustainability performance in 2018, or maintained it, where performance is already at global best practice levels.

This report, compiled and verified independently, addresses five key measures of sustainability, covering resource utilization, recycling, energy efficiency, employment in regional Australia and import replacement. It does so using verifiable and consistent data and with methodologies that meet Australian and international standards.

©Australian Forest Products Association (AFPA), 2018 www.ausfpa.com.au

The 2017 National Pulp and Paper Industry Sustainability Report is published by AFPA. It may be copied, distributed and quoted, with appropriate referencing.

This report was compiled using data from the 2017 calendar year and the 2017-18 financial year.

AFPA and its members and consultants exercised due care and responsibility in compiling the report. However, no liability can or will be accepted for decisions taken on the basis of its contents.
In Australia, local production of paper and paperboard was a substantial 3.251 million tonnes in 2017-18\(^1\). Production is centred around regional Australia, supporting 18,200 direct jobs\(^2\) and more than three times that many across the economy. The sector earned AUD1.086 billion of export income, displacing imports estimated to be valued at more than AUD4.5 billion\(^3\).

As the industry continues to grow to meet Australia’s demand for paper and paper products, it continues to recover and recycle ever-larger volumes of fibre resources. In 2016-17, recycling\(^4\) accounted for 3.059 million tonnes of paper and paperboard\(^5\).

**Paper and paper products are everywhere!** From notepads, copy paper and newsprint to massive volumes of corrugated boxes and other packaging, all the way to personal hygiene products like tissues and hand towels, paper plays a fundamental role in modern life.

In Australia, local production of paper and paperboard was a substantial 3.251 million tonnes in 2017-18\(^1\). Production is centred around regional Australia, supporting 18,200 direct jobs\(^2\) and more than three times that many across the economy. The sector earned AUD1.086 billion of export income, displacing imports estimated to be valued at more than AUD4.5 billion\(^3\).

As the industry continues to grow to meet Australia’s demand for paper and paper products, it continues to recover and recycle ever-larger volumes of fibre resources. In 2016-17, recycling\(^4\) accounted for 3.059 million tonnes of paper and paperboard\(^5\).

To grow its role in Australia’s economy, supplying a growing population with the products it needs now, and into the future, the pulp and paper industry needs to expand. From an estimated AUD8 billion in total investment in 2018\(^6\), total investment needs to grow by as much as 20% over the next five years, to increase domestic supply, replace imports and employ more people in regional Australia.

Australia’s pulp and paper manufacturing industry is one of the most advanced manufacturing sectors of the Australian economy. Its technological sophistication, extent of investment and potential to contribute to the emerging bio-economy and add value to its own circular economy is almost without peer.
While increasing production and recycling, the industry has continued to improve its environmental performance. Since 2014-15, direct emissions of greenhouse gases have been reduced by 5.1% (equivalent to 29,192 cars) and energy intensity fell by 5.3% (equivalent to the energy required to power 122,252 houses).

To support the further development of the sustainable pulp and paper industry in Australia, AFPA and its members have called for one billion new production trees located near major processing facilities, and for substantial investment in a National Biofutures Industry Development Fund and Bioproducts Innovation Hub.

Increasing fibre available to manufacture paper and paperboard is key to ensuring a reliable and continuous supply of high-quality, domestic products, with all the co-benefits that delivers.

This report, prepared independently and presented in precise and clear formats, demonstrates that the pulp and paper industry is a sustainable and continuously improving industry of regional importance and national significance. It is an industry of which Australia and Australians can rightly be proud.

Australia’s sustainable pulp & paper industry

2017 Australian Pulp & Paper Industry Sustainability Report

- 60,820 full time equivalent jobs
  - 12,450 direct, full time employees
  - > 30,000 jobs in regional Australia

Regional employment

- >95% certified wood fibre
  - All Australian manufactured pulp is independently certified

Fibre sustainability

- Energy efficiency
  - Emissions reductions = 29,192 more cars off the road in 2016-17
  - Reductions in energy use sufficient to power 122,252 houses in 2016-17

Energy efficiency

- Annual trade
  - Exports valued at AUD 1.086 billion
  - AUD 4.5 billion imports replaced

Global best practice recycling

- 69.6% of all paper recycled

2018 National Pulp & Paper Sustainability Report 3
Combined, more than 24.9 million hectares of Australia’s 38.6 million hectares of potential production forests and plantations\(^8\) are independently certified by third party organisations. Analysis of publicly available data shows that 100% of plantations and all publicly owned production forests are certified\(^9\).\(^{10}\).

Nearly all fibre sourced from Australia’s plantations and forests is extensively certified by either the Australian Forestry Standard (AFS), which is an endorsed scheme of the Program for Endorsement of Forest Certification schemes (PEFC) or Forest Stewardship Council (FSC), and in some cases both. The exception is small quantities of material sourced from private owners.

**Fourth largest area of certified forests and plantations**

As the table below shows, Australia has the third largest area of certified forests and plantations\(^11\) in the world. Much more heavily forested countries fall far behind on this measure.

**ALL Australian made pulp is independently certified**

All the virgin fibre pulp made in Australia and used to manufacture paper and paperboard is certified by either the AFS/PEFC or FSC. In addition, almost all – and in some years it may be all – of Australia’s pulp imports are also independently certified.

\(^12\) FSC ‘Facts & Figures – December 2017’  
\(^13\) PEFC ‘Annual Review, 2017’
Australia’s implied recycling rate for all paper and paperboard in 2017-18 was 69.6%, having declined marginally (0.7%), due to apparent stockpiling of some grades of recovered paper and the rapid growth in pre-packaged goods purchased through e-commerce transactions.

Over the year, Australia’s total consumption of paper, paperboard and paper products was estimated to be 4.799 million tonnes, not all of which is available for recycling.

IndustryEdge reports that for the year-ended June 2018, fibre recovery totaled 3.058 million tonnes, consisting of local utilization of 1.667 million tonnes and exports totaling 1.391 million tonnes\(^\text{14}\).

By comparison with Australia’s 69.6% recycling rate, in Europe\(^\text{15}\) in 2017, the total recycling rate for paper and paperboard rose marginally to 72.3% of consumption\(^\text{16}\). In the same year, the recovery rate in the US declined in a manner similar to Australia’s, slipping back to 65.8%\(^\text{17}\).

### Global Best Practice Recycling

Recycles \textbf{69.6\%} of paper and paperboard

---

2018 National Pulp & Paper Sustainability Report 5
In calendar year 2017, Australia’s newsprint recycling rate was 75.4%\textsuperscript{18}, compared with 72.8% in the USA\textsuperscript{19}. 76.6% of paper-based packaging material is recycled.

Australia’s packaging and industrial paper recovery rate (think of corrugated boxes, cereal boxes and the like) was calculated to be 76.6%\textsuperscript{20} in 2017-18, after accounting for non-recyclable material. This compares with 73.7% in Europe\textsuperscript{21}.

Australia’s recovery and recycling of paper and paperboard has increased dramatically over the last ten to fifteen years. Australia’s strong position has been made possible because of increasing recovery rates, both from kerbside collections and from commercial and industrial sources and because of significant industry investments in paper recycling capacity.

Recent trade challenges for exported recovered paper supplies demonstrate that industry, government at all levels, and the community need to constantly consider opportunities to advance towards a circular economy, in which recovery and recycling of scarce and valuable fibre resources is designed into industrial processes and supply chains.
Towards Zero Landfill’ remains an important objective for Australian Paper’s Maryvale Mill. The Mill has been established in the Latrobe Valley for 80 years and is one of the region’s largest employers.

As an integrated pulp and paper manufacturer, Australian Paper Maryvale’s operations generate organic materials that can’t be used to manufacture paper. As part of its commitment to developing a circular economy, Australian Paper continues to explore new options for this material, progressively reducing landfill.

Ongoing work – over more than a decade – has seen a dramatic reduction in the volume of solid waste being sent to Maryvale’s onsite landfill. As a result of a partnership with local business PineGro, in 2017 nearly 130,000 m³ of Maryvale’s organic waste material was recycled into valuable agricultural products used for composting and soil remediation. Australian Paper has also successfully eliminated unburnt lime particles from its waste stream. This material is now transformed into high quality soil conditioner used in the agricultural industry. This waste type previously accounted for more than 2,000 m³ per annum of landfill.

Maryvale Mill’s 2017 goal was to reduce waste being sent to onsite landfill to a total of 8,000 m³. This target was exceeded by almost 18%, with a total of just 6,570 m³ being sent to its landfill.
5.1% reduction in direct emissions – equivalent to 29,192 less cars on the road

The Australian paper industry reduced its direct emissions22 by 5.1% from 2014-15 to 2016-1723. Over the same period, the net energy used by the industry declined 0.1%. Industry investment in reducing emissions was equivalent to removing 29,192 cars from Australia’s roads24,25.

5.4% reduction in energy intensity – equivalent to 122,252 houses

Australia’s production of paper and paperboard rose by a reported 210,000 tonnes26, or 5.4% from 2014-15 to 2016-17. Total energy use rose by a very small 1.6% over the two years, while energy intensity fell by 5.3%27. That means that the pulp and paper industry saved energy equivalent to the electricity used to power 122,252 houses while increasing its production28.

Energy use and emissions are falling every year

![Graph showing energy use and emissions trends from 2013-14 to 2016-17.](source: NGERS & IndustryEdge)

---

22 Direct emissions are reported under ‘Scope 1’ of the National Greenhouse and Energy Reporting scheme. For further information on NGER go to www.cleanenergyregulator.gov.au/NGER
23 NGER, ‘Corporate emissions and energy data from 2014-15 to 2016-17’
27 This energy intensity measure was calculated by dividing ‘net energy consumption’ data reported under the NGER scheme with paper and paperboard production data assembled annually and reported by IndustryEdge. The 2016-17 data was compared with the 2015-16 data
Catalogue, brochure, magazine and newsprint production results in 20% less direct CO\textsubscript{2} e emissions, thanks to a major investment at Norske Skog’s Boyer Mill in Tasmania.

A new system, designed on site, integrated to existing operations and built using second-hand equipment sourced from the international market, recovers heat, converts it to steam and reuses it to reduce CO\textsubscript{2} e emissions across the mill.

The steam is used to help dry paper. Using recovered heat means the Boyer mill now uses significantly less coal to generate new heat and steam. The result is lower emissions and reduced energy costs.

The initiative, one of the earliest industrial processes supported through the Emissions Reduction Fund (ERF) removes an estimated 37,000 tonnes of CO\textsubscript{2} e from the atmosphere, every year.

To put the emissions’ reduction into context, that equates to 14,846 standard vehicles removed from the roads, each and every year.

The reduced use of coal also improves the Boyer mill’s overall energy costs, helping them remain viable in a globally competitive market.

**Delivering baseload energy from renewable biomass**

Several of Australia’s pulp and paper mills produce baseload (continuous supply) electricity, as well as thermal heat, from renewable, biomass energy.

In 2016-17, bioenergy supplied 10% of Australia’s renewable electricity\textsuperscript{29}, but is the key source of renewables able to deliver baseload. The sector continues to examine opportunities to develop its delivery of baseload electricity to the grid, potentially accessing the AUD100 million Australian Bioenergy Fund \textsuperscript{30}.

---

\textsuperscript{29} Department of the Environment & Energy, ‘Australian Energy Update 2017’

Australian Paper’s Maryvale Mill is the largest generator of baseload renewable energy in Victoria, meeting 51% of its energy needs. The Mill is also the biggest industrial user of natural gas in Victoria, and a significant electricity consumer.

Australian Paper is committed to addressing its future energy needs proactively, and in 2017, announced a $7.5 million feasibility study into a $600 million Energy from Waste (EfW) facility at the Maryvale Mill, supported by the Australian and Victorian governments.

This EfW facility would divert approximately 650,000 tonnes of residual waste household from Gippsland and Melbourne landfills each year, saving approximately 550,000 tonnes of carbon emissions annually. It would also support more than 1,600 Victorian full-time equivalent jobs during construction, and over 440 ongoing, including flow-on impacts.

The EfW process creates thermal energy, ideal for pulp and paper manufacturing where large quantities of steam are required. The facility would generate 225 Megawatts of thermal energy at an estimated 58% efficiency based on Combined Heat and Power (CHP) output.

The feasibility study will examine the environmental, social, technical and commercial feasibility of building an EfW facility at Maryvale. South-East Melbourne faces significant landfill shortages with around 750,000 tonnes of annual landfill capacity set to close over the next five years. EfW is proven, low emissions technology with more than 500 similar operations in Europe and is a missing link in Victoria’s waste hierarchy.

As a major part of the study, Australian Paper established a project information office in the centre of Morwell to engage with the local community.

As the study continues throughout 2018, the community remains involved. The plant could be constructed and operational within 5 years.
Community & Economic Contribution

Regional Employment

Contributes up to 60,820 full time jobs in Australia

In June 2017, approximately 18,200 people were directly employed in Australia’s pulp, paper and paper products industry31,32. Based on an independent socio-economic assessment33, it has been estimated that nationally, up to 60,820 jobs are sustained by the industry, more than half of which are in regional Australia.

Annual Trade

Exports valued at AUD1.086 billion in 2017-18

In 2017-18, Australia imports of paper for printing and writing, advertising, packaging and personal care were valued at AUD2.757 billion. Its exports of the same products were valued at AUD1.086 billion, representing a balance of trade deficit of almost AUD1.671 billion34. The deficit was 2.4% lower than for the prior year.

Local production replaces estimated AUD4.5 billion in imports

Supporting Australia’s economy, each year, the local pulp and paper manufacturing industry’s annual production replaces imports whose estimated value is greater than AUD4.5 billion35.

Regional secondary students compete on global stage with paper company support, as STEM takes centre stage

More than just a local dream, with the support of Visy Pulp & Paper, Tumut High School’s F1™ in Schools team has taken on the world, in Singapore at the World Championships in August 2018.

F1™ in Schools is a rigorous, holistic, worldwide challenge which incorporates the use of design and technology into the real world. Students are essentially placed in charge of an F1 Company: from designing a miniature F1 car that reaches speeds of 80km/h, the manufacturing of the vehicle, the team marketing, to the securing of stakeholders and management. It is all a part of the competition!

In their first ‘season’, the Tumut High School Team was second placed at the Australian national finals, earning the right to compete in the World Championships.

The Tumut High School team was recognized at the Australian National Finals for more than its engineering, design and of course, the speed of their vehicle. They also won awards for Best Managed Enterprise, Best Team Marketing, Best Graphic Design and Best Newcomers!

The F1™ in Schools STEM Challenge imitates the world of a Formula One team. Groups of students have to follow a pathway of engineering and manufacturing disciplines: design, analyse, test, make and race. They are provided with access to real-world technology such as 3D CAD/CAM/CAE engineering design software and quickly become proficient in areas such as Coding, Computational Fluid Dynamics and Finite Element Analysis.

This practical, integrated and inspiring STEM program is multi-faceted and multi-disciplined. It is about much more than cars, although the idea of being involved in car design has proved to be a powerful means of attracting even the most uninitiated students to discovering more about STEM.

Each year, more than 22,000 high school students in Australia are involved in the F1™ in Schools program. Australian teams have won the F1™ in Schools World Championship six times, including in both 2017 and 2018.

STEM education and training is critical for all workers in every modern pulp and paper mill, especially in regional areas, where external skills can be less reliable. Building the regional STEM skill base is a vital part of modern manufacturing regions.

Visy Industries has been the proud principal supporter of Tumut High School’s F1™ in Schools team since its inception, helping local children, from regional Australia, compete with the best of the rest of the world.

12 2018 National Pulp & Paper Sustainability Report
About AFPA

AFPA is the peak national industry body representing the Australian forest, wood and paper products industry’s interests to governments, the general public and other stakeholders on matters relating to the sustainable development and use of Australia’s forests and associated manufacturing and marketing of wood and paper products in Australia.

Member companies

AFPA’s members in the Australian pulp and paper industry are:

- Australian Paper
- Norske Skog Australasia
- Visy Industries
- Circa Group

This report was compiled for AFPA and its members by the independent industry analyst and market research firm IndustryEdge (www.industryedge.com.au)

The data used to establish this report is publicly available or otherwise reported by AFPA members. It was verified and aggregated by IndustryEdge.

Data referenced to NewsMediaWorks was also researched by IndustryEdge, through comprehensive industry surveys, undertaken in accordance with approved methodologies.
